(a) Prove, using the Pumping lemma for Regular Languages, that there is no Universal Regular Expression.

The universal regular language (URE) takes in the form of  $R\$x$  where  $R$  is the regular expression and  $x$  a string which is accepted by  $R$ . This must hold for all  $R$  and input  $x$  that are accepted by  $R$ .

To show that URE is not a regular language:

Assume that URE is a regular language. Therefore for any  $R$  that accepts an input  $x$ ,  $R\$x$  belongs to the URE Language. The alphabet is :  $\{a, b, \cup, *, (, ), \epsilon, \emptyset, \$\}$

Therefore, we can use pumping lemma for a string accepted by URE. If all cases of pumping lemma results in a string that is no longer part of URE, then we know URE is not regular language.

Pumping lemma

If URE language is regular, then there must exist a pumping length  $p$  such that any string  $s$  in URE language of length  $|s| \geq N$  can be split into  $w = xyz$

1.  $|xy| \leq N$
2.  $|y| > 0$ ,
3. For all  $i \geq 0$ ,  $xy^iz$  is also a part of URE L

Let's consider the regular expression that describes a string that is static in length, such as a string of  $b$ 's to some arbitrary length  $N$ .

$S = R \$ x$  where  $R: \underbrace{bbb \dots b}_{N \text{ length}}$

$\therefore x: \underbrace{bbb \dots b}_{N \text{ length}}$

So  $U$  accepts  $w = \underbrace{bbb \dots b}_{N \text{ length}} \$ \underbrace{bbb \dots b}_{N \text{ length}}$   
both same length  $N$

then we have 2 possible scenarios as  $|xy| \leq N$  and  $y \neq \epsilon$

$\underbrace{bbb \dots b}_{N \text{ length}} \$ \underbrace{bb \dots b}_{N \text{ length}}$   
 $xy$  must be restricted to this range

Scenario 1:

$y = \underbrace{bbb \dots b}_{N \text{ length}} \Rightarrow$  if we pump  $y$  then we get:

$w_2 = \underbrace{bbb \dots b}_{2N \text{ length}} \$ \underbrace{bbb \dots b}_{N \text{ length}}$

For this scenario  $w_2$  is not accepted by  $U$  as  $R$  does not match  $x$  as  $R$  is looking for  $b$ 's of length  $2N$  while  $x$  is only length  $N$

Scenario 2:

$$y = \underbrace{bbb \dots b}_{k \text{ length}} \quad \Rightarrow \text{pumping } y \text{ gives us:}$$

$$w_3 = \underbrace{bbb \dots b}_{N+k \text{ length}} \& \underbrace{bbb \dots b}_{N \text{ length}}$$

where  $k < N$

For this scenario,  $w_3$  is not accepted as  $R$  is looking for  $b$ 's of length  $N+k$  while  $x$  is  $b$ 's of  $N$  length

As pumping lemma has failed for all possible  $y$ 's in a string accepted by  $U$ ,

URE is not regular.

Therefore URE  $U$  regular expression does not exist

(b) Prove, using the Pumping lemma for Context-Free Languages, that there is no Universal Context-Free Grammar.

This question has the same set up as the previous question, but in the context of Context-Free Language rather than regular language

Let  $k$  be the number of nonterminal symbols in Universal Context-Free Grammar  $U$ .

For any  $U$ , consider the following Context-Free Grammar  $G$ :

$$\begin{aligned} S &\rightarrow T_1 \\ T_1 &\rightarrow a \\ T_1 &\rightarrow T_2 \\ T_2 &\rightarrow aa \\ T_2 &\rightarrow T_3 \\ T_3 &\rightarrow aaa \\ &\vdots \\ T_N &\rightarrow a^N \end{aligned}$$

Where any terminal  $T_n$  can be expanded to  $a^n$  or  $T_{n+1}$  until the final terminal  $T_N \rightarrow a^N$

And pick the  $x$  string accepted by this as  $a^N$

In the language  $U$ , we can pick the string:

$$w = S \rightarrow T_1 ; \underbrace{T_1 \rightarrow a ; T_1 \rightarrow T_2 ; \dots ; T_N \rightarrow a^N \& a^N}_{N \text{ repetitions of}}$$

$$T_n \rightarrow a^n ; T_n \rightarrow T_{n+1} \quad n \geq 1$$

It's important to understand that each terminal  $T_{n+1}$  relies on  $T_n$  for  $n = 1$ . Once we do some pumping lemma, we can see that removing any terminals within  $G$  will break the input string  $a^N$  (which is the largest string possible)

Take  $N > 2^{k-1} / 3$

Consider any  $u, v, w, y, z$  such that

- $vy \neq \text{empty string}$
- $|vxy| \leq 2^k$
- $w = uvxyz$

We must test whether:

$uxz, uvxyz, uv^i xy^i z$  for  $i=0 \rightarrow \text{infinity}$  are all in  $U$ ?

Case 1:

$v$  and  $y$  are within the  $N$  repetitions of  $T_n \rightarrow a^n$ ;  $T_n \rightarrow T_{n+1}$

$$w = S \rightarrow T_1 ; \underbrace{T_1 \rightarrow a ; T_1 \rightarrow T_2 ; \dots}_{v} ; \underbrace{T_N \rightarrow a^N}_{y} \& a^N$$

If we consider removing the  $v$  and  $y$ , and consider the string  $uxz$ :

$$S \rightarrow T_1 ; T_1 \rightarrow a ; T_1 \rightarrow T_2 ; T_N \rightarrow a^N ; \dots T_N \rightarrow a^N ; a^N$$

disconnect between  $T_2$  and  $T_N$

Note:  $T_2$  was just an example of where the disconnect can be it can be anywhere

This is no longer part of the language because there is now a disconnect between the terminals. Without the connection,  $S \rightarrow T_1$  cannot be expanded to  $T_N \rightarrow a^N$ , making  $a^N$  invalid

$$uxz \notin U$$

Case 2:

$v$  is within the  $N$  repetitions of  $T_n \rightarrow a^n$ ;  $T_n \rightarrow T_{n+1}$ , and  $y$  is within the  $a^N$  string

$$w = S \rightarrow T_1 ; \underbrace{T_1 \rightarrow a ; T_1 \rightarrow T_2 ; \dots}_{v} ; T_N \rightarrow a^N \& \underbrace{a^N}_{y \leq a^N}$$

If we pump  $v$  and  $y$  to produce some variation of  $uv^i xy^i z$ , then:

- The repetition of  $v$  causes a repetition of the set of context grammar rules within  $G$  of the word.
- The repetition of  $y$  causes  $a^N$  to be expanded to  $a^{N+n}$

The repetition of the rules do not accommodate the new larger  $a^{N+n}$  string, therefore the string  $uv^i xy^i z$  is not accepted by  $U$

$$uv^2 xy^2 z \notin U$$

In every possible case, we have found an  $i$  such that  $uv^i xy^i z$  is not accepted by  $U$ , which violates the conclusion of Pumping Lemma for CFLs.

Therefore UCFG is not context-free, meaning  $U$  does not exist by definition that it must be a context free grammar.
